For NRI Group, ESG awareness starts with whole staff

ESG Talk

TOMOKO KAICHI CONTRIBUTING WRITER

In 2019, Nomura Research Institute Ltd. formulated a medium-term business plan through fiscal 2022, pledging to promote "sustainability management policy" to achieve growth for the group and at the same time help create a sustainable future society.

The company aims to become a "presence that is indispensable to our society" through its work by experts in wide-ranging fields, including science, technology and economics, to resolve issues that society faces. To achieve this, NRI Chairman and President Shingo Konomoto said, "It's important to raise the awareness of each employee about issues." NRI puts a lot of effort into communicating information on its environmental, social and governance (ESG) efforts both to its members and to the public.

NRI was established in 1965 as Japan's first private comprehensive think tank. Having merged with Nomura Computer Systems Co. Ltd. in 1988, NRI's strength lies in its ability to provide a one-stop service covering everything from consulting to IT solutions. Domestic deals make up about 90% of NRI's IT solution business, which generates 90% of its overall revenue. It plans to step up efforts to expand business overseas, which it began in earnest four to five years ago.

NRI's founding prospectus in 1960 states at the beginning its goal of "revitalization of

industry and the economy through study and research and contribution to society at large." Konomoto said: "Current trends such as ESG and SDGs (U.N. sustainable development goals) describe in different words the hopes we had at our foundation. We have passed on that hope for more than 50 years."

Konomoto said his assignment in Taiwan in the 1990s made him realize that stakeholder-centric thinking, which is gaining currency around the world, had already taken root among many Japanese companies, including NRI, many years ago. Being outside his home country and looking at it from the outside also made him realize some things. One was that Japan was behind in promoting diversity in workplaces, especially including female empowerment. The work environment has since improved for women, but he thinks the social infrastructure supporting women's employment remains inadequate. According to Konomoto, an internal survey NRI conducted on the impact of promoting women to managerial positions highlighted many cases indicating that female managers excelled at increasing staff engagement and motivation. "The company cannot maintain competitiveness unless staffers feel their work is rewarding," Konomoto said. He showed enthusiasm for building on track records of improving his company's work environment and promoting female empowerment.

The COVID-19 pandemic has brought many changes to society, including accel-

erated digitalization of work and services. Konomoto says the "consolidation of business and IT" is certain to happen. "The new coronavirus pandemic hit just as technologies, including artificial intelligence and algorithms, were advancing and expanding, and this abruptly accelerated digital transformation," he said. "We're going to continue to put efforts into offering ideas that take advantage of our knowledge in both business and IT. In the meantime, there is the need on the customers' side to train personnel who can think of both aspects at the same time." There are often conflicts of interest when business and corporate cultures are reformed, and in order to solve them, he said, it is essential for the top management to show their vision. Konomoto said he has a strong sense of

crisis about environmental issues and that the key to resolving them is to "promote provision of services through digital platforms and shift to a sharing economy." If the use of online services increases and a sharing economy is adopted more widely, it will reduce energy usage and environmental load. "Unlike China and the United States, which can produce unlimited amounts of renewable energy, Japan has limitations - it has severely limited in terms of locations for installing solar panels, for example," Konomoto said. "We have to find ways to live a satisfying life without using (large amounts of) energy, by cleverly using digital technology."

NRI is leading the way in efforts to offer measures for this. For example, it recommends financial institutions use shared

ent companies. In the logistics field, it has worked to use technology to optimize customers' transportation routes and learned that they can, in theory, use just seven trucks to handle an amount of freight that previously required 10. Konomoto thinks Japan overall can improve efficiency of energy use if there is a structure in place to encourage the use of technology for the entire country, which he believes will allow new ideas to be gathered from wide-ranging areas.

NRI was relatively early to start efforts to disclose ESG information under international standards, participate in the Japan Climate Initiative and obtain certification from international frameworks, including the Task Force on Climate-Related Financial Disclosures. The message sent from such efforts reaches NRI's employees, totaling nearly 13,500. "I want each of our employees to be aware of how their daily work creates value for our society and contribute to solving

issues," Konomoto said. "We will continue to put efforts into activities to ensure that."

The ESG Talk series are interviews with business leaders who are active proponents of ESG investing and practices in Japan.

Kirirom Global Forum examines investment and social impacts

ESG/SDGs

Kirirom Group, a network of companies in Singapore, Cambodia and Japan that focuses on startup studio business and regional development, conducted the Kirirom Global Forum 2021 Summer from Aug. 9 to 11. Until last year the event was held at the Kirirom Institute of Technology in Cambodia, which is also run by the group, but this time all 50 panel discussion sessions took place online.

Each session dealt with topics from one of six themes: global business, global investment, global education, working globally, social issues and world-changing technologies. More than 150 panelists from various industrial sectors, government organizations and academic institutions shared their insights to inspire and encourage the online audience to think about how one can play an active role on a global level and create the business opportunities and connections necessary to be internationally successful.

One of the sessions focused on movements in finance and industrial sectors toward the realization of carbon neutrality. Tsutomu Sato, director of the Japan Bank for International Cooperation's Global Environment Division and deputy director general of its New Energy and Power Finance Department II, said the private sector is quicker to adopt changes: "The public started to change following the trend in the financial sector. Why the financial sector instead of politics? It is

quarters, said it is also important to steer national governance toward decarbonization, but "There are so many other issues that weigh heavily on society and the economy, too. We need to ensure that a solution for one of the problems will not work against the others."

Sumiko Takeuchi, a senior fellow and member of the board of directors at the International Environment and Economy Institute as well as a co-founder and president of U3 Innovations LLC, also pointed out that climate change is not the only issue that the world is facing, and making drastic changes in only this field could cause distortions in other areas. She stressed that a sense of balance and a pluralistic perspective are necessary. "Global issues are diverse — so are their solutions," she said, explaining that Japan, a country of yao yorozu no kami — "8 million gods" found in every part of nature and human life — should take the initiative in advocating to the world that our goals should not be "climate change and 16 others."

> erated by Yukimasa Yasuda, the board group CFO of vKirirom Pte. Ltd., that focused on impact investment, Takayuki Sakakida, president of Kyoto Shinkin Bank, spoke of the kind of initiative that Japan should take: "Japan, as a country with social issues such as an aging

population and a declining birthrate, should take the initiative in making the flow of money in both direct and indirect financing more impact-based." Japanese people have always had, he said, "the sentiment of changing their actions for the Earth." On the other hand, he said, it is a pity

that Japan's contributions to the world have been poorly recognized. "Japan's presence is not appreciated. We are good people but lack visibility. Human resources, ideas, originality — not much of anything is being sent out to the world from Japan." He expressed hope that more Japanese money will be invested into areas with greater social impacts and that the world will value Japan for that.

Ken Shibusawa, founder of Commons Asset Management Inc. and a descendant of the industrialist Shibusawa Eiichi the "father of Japanese capitalism," who championed the principles of morality and business (rongo and soroban) — said Japanese capitalism has pursued the maximization of social value instead of profit since its beginning. "I think that the essence of impact investment already existed in modern Japan, where enterprises aimed to make profit not for its own sake but for making social impact," he said. To pass on this idea and make its impact more visible on a global level, he stressed that Japan should invest more in developing countries.

This section highlights the environment and a sustainable society.
